/note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with
a modified polylinker; Site 1: Not I; Site 2: Eco RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NbHL19W, testis NHT, and B-cell
NCI CGAP GCB1) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.A.G.E. clones 297480-302087, 682632-687239,
726408-728711, and 729096-31339. Subtraction by Bento
Soares and M. Fatima Bonaldo. "

following tissue(s): retina. The library was const according to Bonaldo, Lennon and Soares, Genome R6 6:791-806, 1996. First strand CDNA synthesis was I with an obliqo-dr primer containing a Not I site. I stranded CDNA was ligated to an ECOR I adaptor, di with Not I, and cloned directionally into prime the vector. The oligonucleotide used to prime the synt first-strand CDNA contains a library tag sequence located between the Not I site and the (d7)18 tail sequence tag for this library is CCGCG. This libra created for the program, Gene Discovery in the Vii System, supported by National Eye Institute (NEI)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Eutele Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo. UT-B-CLI is a normalized cDNA library containing the
following tissue(s): retina. The library was constructed
according to Bonaldo, Lennon and Soares, Genome Research,
e; 791-806, 1996. First strand cDNA synthesis was primed
with an oligo-dT primer containing a Not I site. Double
stranded cDNA was ligated to an EcoR I adaptor, digested
with Not I, and cloned directionally into pT7T3-Pac
vector: The oligonucleotide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail. The
sequence tag for this library is CGGG. This library was
created for the program, Gene Discovery in the Visual

The library was constructed according to Bonaldo, Lennon and Soar Genome Research, 6:791-806, 1996. First strand Genome Research, 6:791-806, 1996. First strand of synthesis was primed with an oligo-dT primer cont Not I site. Double stranded cDNA was ligated to adaptor, digested with Not I, and cloned directic into pT73-Pac vector. The oligonucleotide used the synthesis of first-strand cDNA contains a libracy equence that is located between the Not I site of (d))18 tail. The sequence tag for this library is CATTAAAGTO. This library was created for the prog Discovery in the Visual System, supported by Natil Institute (NEI)."

a modified polyliher; Site1: Not I; Site 2: Eco RI;
a lasmid DNA from the normalized library NCT CGAP Kid5 was
prepared, and sg circles were made in vitro. Following HAP
purification, this DNA was used as tracer in a subtractive
hybridization reaction. The driver was PCR-amplified cDNAs
from a pool of 5.000 clones made from the same library
(cloneIDs 1323912-1328831, 1471368-1472903 and
H492104-1493255). Subtraction by Bento Soares and M.
Patima Bonaldo. "

/note "Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with
a modified polylinker; Site 1: Not I; Site 2: Eco RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NbHL19W, testis NHT, and B-cell
NCI CGAP GCB1) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.A.G.E. clones 297480-302087, 682632-687239,
726408-728711, and 729096-731399. Subtraction by Bento
Soares and M. Fatima Bonaldo. "

(destroyed); RNA source leukocytes from anonymous pool of
non-activated adult donors. Library is oligo-dr primed
and directionally cloned (EcoRV site is destroyed upon
cloning). Average insert size 1.7 kb, insert size range
lu.2-3.3 kb. Library is normalized and enriched for
full-length clones and was constructed by C. Gruber
(Invitrogen). Research Genetics tracking code 027. Note:

We are not submitting the same cDNA sequence redundantly t
since 1993. For the abundance information of clones with
sequence in this library and as well as in other 3'-direct
libraries, see 'http://www.imcb.osaka- u.ac.jp/bodymap'.
sequences of the clones represented by this GS sequences:
Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Eutele
Mammalia, Eutheria, Primates, Catarrhini, Hominidae, Homo.

Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI CGAP GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was were materacer in a subcractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made Iron the same 3 libraries. The pools consisted of Iron the same 3 libraries. The pools consisted of Iron A.G.E. clones 297480-302087, 685632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo.

a lipha gene useful for preparing a composition for treating a lated with excessive or insufficient bone resorption e.g., Paget's disease or arterial calcification.

SQ ID NO 23; 145pp; English.

relates to an isolated nucleic acid molecule encoding a is factor family ligand. A composition comprising the body or its fragment is used for treating an individual in ased level of endokine alpha activity. The endokine alpha resent in a heterotrimeric complex is used for treating an ving a disorder associated with excessive bone resorption, sigh, Paget's disease or arterial calcification. Treating an ving a disorder associated with insufficient bone resorption inistering an endokine alpha antagonist, which is the

\$888	antibody that binds specifically to endokine alpha polypeptide. The present sequence represents a cDNA encoding a tumour necrosis fact family ligand.

TICS INST INC.

Resnick RJ; SH, Howes Agostino MJ, ĸ, Fechtel ark HF, Fe Graham JR; 9321/23 l and ninety two polynucleotides derived from a variety of sources which encode secreted proteins, useful for treating sencies and disorders such as autoimmune disorders.

le 82; 372pp; English.

in relates to 592 polynucleotides which have been derived from human tissue sources and which encode novel secreted is polynucleotides can be used as probes for the con and isolation of full length cDNA and genomic DNA. The des and proteins can also be used as nutritional supplements.

The proteins are useful in the treatment of various immune deficiand disorders such as viral infections, bacterial infections, fun infections, autoimmune disorders (e.g. rheumatoid arthritis, mult sclerosis, autoimmune thyroiditis and diabetes) and allergic read and conditions (e.g. asthma). They are also useful for treating neurodegenerative diseases (e.g. Alltheimer's disease, parkinson's disease), liver fibrosis, coagulation disorders (e.g. haemophilis inflammatory disorders (e.g. Crohn's disease) and tumours. They a useful for tissue regeneration, for wound healing and in the tree haematopoiesis and ulcers. The proteins are also useful for recharematopoiesis and for treating myeloid or lymphoid cell deficient Sequences ABK34863-ABK35454 represent polymucleotides of the inve CAGACAGAAGAAAGCCAGGATCCTGCGCCTTTCCTGAACCGACTAGTTCGGCCTC 365 AGTGCACCTAAAGGCCCGGAAAACACGGGCTCGAAGAGCGATCGCAGCCCATTATG TCCGCCCGCCGGCTCCCCCCCGATCCCTCGGGTCCCCGGGATGGGGGGGCGG 5 rececedecederecerrececedareceredeserecedes and segmentations of the segment of 85 CAGGCACAGCCCCCCCCCCATGGCCGCCCGTCGGAGCCCAGAGGCGGAGGGGC 65 CAGGCACAGCCCCCCCCCATGGCCGCCGTCGAGACCAGAGGCGAAGGGGGGC GGGGAGCCGGCCACCGCCTGCTGGTCCCGCTCGCGCTGGGCCTGGGCCTGGGCGC TGCCTCGGCCTCCTGCTGGCCGTGGTCAGTTTGGGGAGCCGGGCATCGCTGTCCG recercedecteracradecerateracrateradadecesacerecerates GAGCCTGCCCAGGAGGAGCTGGTGGCAGAGGAGGACCCAGGACCCGTCGGAACTGA CAGACAGAAAGCCAGGATCTTGCTTTCCTGAACCGACTAGTTGGCCTT 385 AGTGCACCTAAAGGCCGGAAAACACGGGCTCGAAGAGCGATCGCAGCCCATTATG 505 GAGGAAGCCAGAATCAACAGCTCCAGCCCTCTGCGCTACAACCGCCAGATCGGGG ses atagicacccooogcioogciciactaccigiacricicagorgcactitgargag 545 ATAGTCACCCGGGCTGGCTCTACTACTGTCAGGTGCACTTTGATGAGG 625 GCTGTCTACCTGAAGCTGGACTTGCTGGTGGATGGTGTGCTGGCCCTGCGCTGCC 0; DB 6; Length 1364; Sequence 1364 BP; 246 A; 461 C; 394 G; 263 T; 0 U; 0 Other; Indels 5; Mismatches Score 1247; Pred. The present sequence is that of cDNA clone DNA30879-1152 (AICC 205 encoding human PRO207 (see AAY95338), which shows homology to seve members of the tumnour necrosis factor family, especially human [1] in the cDNA was identified in a foetal kidney of library following identification of an expressed sequence tag with homology to human Apo-2 ligand. A claimed method for inhibiting the complete of at unour cell comprises exposing the tumor cell to PRO1. PRO207, PRO309, PRO219, PRO221, PRO224, PRO328, PRO301, PRO506, PP PRO366, (see AAY95337-49), their agonists or chim peptides incorporating them. The tumour is especially a cancell ung, bladder and central nervous system cancer, melanoma and lewing Laborating PRO316, are used in the recombinant professional production of the compliant professional productions.

.g human PRO207 polypeptide.
benign tumour; malignancy;

```
The present invention relates to the isolation of novel human PR polypeptides and the polynucleotide sequences encoding them. The polypeptides, agonists, antagonists or anti-PRO antibodies are user treating benign or malignant tumours (e.g. renal, kidney, bladdebreast, etc), leukaemias and lymphoid malignancies, other disord as neuronal, glial, astrocytal, hypothalamic, glandular, macroph stromal and blastocoelic disorders; inflammatory, immune and ang disorders. The polynucleotide sequences are also useful in gene ABK40254-ABK40288 encode for the human PRO polypeptides of the in
leukaemia; neuronal disorder; stromal disorder; blastocoelic disoinflammatory disorder; immune disorder; angiogenic disorder; gene therapy; cytostatic; neuroprotective; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    49 CGATCCCTCGGGTCCCGGGATGGGGGGGGGGGGGGAAGGCAAGCCCCCCCGCCC

The present sequence encodes a human tumour necrosis factor (TNF) lymphotoxin homologue designated Apo-3 ligand, Apo-3 ligand has sytosteated cativity. Apo-3 ligand can be used to induce apoptosis mammalian cancer cells, to induce NF-kappaB-dependent transcript: to induce UNK/SAPK-dependent responses in mammalian cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human tumour necrosis factor Apo-3 ligand polynucleotide sequence

The TNF-related endothelium proliferative agent (TREPA), or its activators or agonists, are used to treat a deficit of TREPA, expremely activators or agonists, are used to treat a deficit of TREPA, expremely also to induce apoptosis for treating cancer and eliminating autor calls, as an adjunct to cancer chemotherapy or antiviral treat TREPA peptides can also be used to target cytotoxic agents or for affinity isolation of the corresponding receptor, the nucleic and affinity isolation of the corresponding receptor, the nucleic and infinite control of the corresponding receptor, the nucleic and the corresponding receptor, the nucleic and the care of the corresponding receptor, the nucleic and infinite and maker and makers are used to treat TREPA-associated infilammation or a wide range of autoimmune conditions, condition involving abnormal stimulation of epithelial cells (e.g. atherosclerosis), for bitth control (inhibiting ownlation and process).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ŭ

The present invention relates to extracellular signal molecules, particularly members of tumour necrosis factor (TNF) family molec designated as TREPA (TNF related endothelium proliferative agent) Soluble biologically active TREPA are used to treat TREPA-associal diseases, tumours or metastases. TREPA is used for inducing angic in human for promoting wound healing and for vascularising grafte for successful grafting and to promote tissue grafts. The present sequence is a cDNA clone ID #690050 encoding human TREPA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inducing angiogenesis in mammal at desired sites for promoting we healing, by administering soluble fragment of extracellular domaitumor necrosis factor related endothelium proliferative agent pro

New Tumor Necrosis Factor family receptor polypeptides and ligan useful for diagnosis and treatment of prostate cancer and develon or gestational abnormalities.

Example VII; Fig 13A; 156pp; English.

Example VII; Fig 13A; 156pp; English.

This invention describes isolated Tumor Necrosis Factor (TNF) fargements, and isolated TNF related ligands 1 and 3 (TNRL1 and Tragments, and isolated TNF related ligands 1 and 3 (TNRL1 and Tragments and isolated TNF related ligands 1 and 3 (TNRL1 and Tragments and isolated TNF related ligands 1 and 3 (TNRL1 and Tragments, APO4 is useful for diagnosing prostate cancer can determining levels of APO4 in an individual. Prostate cancer can determining APO4 selective bindings linked to a therapeu moiety, apo4 polypeptides are also useful for identifying select binding agents, useful in diagnosis/treatment of disease by binding is preferably perform vivo. APO4 polypeptides/ active fragment which is extracellular agenists and antagonists by binding and useful for set vivo. APO4 polypeptides/ active fragment sare also useful in diagnosis cativity. Effective pharmacological agents useful in diagnosis cativity. The method is performed in vivo or in vitro. APO9 polypeptides are also identified using APO4 polypeptides activity. The method is performed in vivo or in vitro. APO polype with a cytoplasmic domain of APO4 and detecting a change in lever all useful as immunogens for preparing antibodies. APO4 is cueful for diagnosis/treatment of developmental or gestational abnormalities. APO8 was transfected to human breast carcinoma companied apoptosis

The sequence represents a DNA from the expression vector pDC409-L which encodes a fusion protein comprising a growth hormone leader leucine zipper multimerisation domain, and the extracellular doma human TWBAK. The fusion protein was used in the isolation of human rWBAK The fusion protein was used in the isolation of human receptor (TWEAKR)-expressing clones from a COS cell human CDNA list a member of the tumour necrosis factor (TNF) and induces angiogenesis. TWBAKR may therefore be used to screen develop TWBAKR agonists and antagonists for the modulation of angiogenesis, to be used in the treatment and diagnosis of human the disorders mediated by angiogenesis include ocular disorders characterised by ocular neovascularisation such as diabetic retirence and plaucoma, retinoblascoma, retinoplathy of prematurity, retrolental fibroplasia, rubeosis, uveitis, macular degeneration corneal graft neovascularisation, and inflammatory diseases such cartolental and metastatic conditions such as sarcomas and carcinom benign tumours and preneoplastic conditions, myocardial angiogene conversional and preneoplastic conditions, myocardial angiogene conversions and preneoplastic conditions, atherosclerc conversions and preneoplastic conditions, atherosclerc neovascularisation, telangiectasia, wound granulation, cor atherosclerosis, peripheral atherosclerosis and

the treatment of the technique of SBH (sequencing by phybridisation).

38043 CDNA sequences, appearing as ACH12789-ACH50831, whose sequence determined by the technique of SBH (sequencing by hybridisation).

included is a purified polypeptide comprising a sequence correspond a reading frame of the novel polymucleotide. The nucleic acid sequence crassing frame of the novel polymucleotide. The nucleic acid sequence in tensity is assessing biodiversities, or in identifying expressed genes or for physical mapping of the human in forensics, in assessing biodiversities, or in identifying muta responsible for genetic disorders and other traits. The nucleotid sequences are also useful as hybridisation probes, as oligomers for for chromosome and gene mapping, in the recombinant production of protein, or in generating antisonse DNA or RNA. The purified poly is useful for generating antisonse DNA or RNA. The purified poly is useful for generating antisonse specific for it. The present of is one of the 30043 isolated collaboration of the printed specification, the companied in electronic format directly from USPTO at
                                                                                         New polynucleotide sequences obtained from various cDNA libraries as hybridization probes, as oligomers for PCR, for chromosome and mapping, in the recombinant production of protein, or in generati

olynucleotide encoding a polypeptide comprising a portion : protein, for detection, diagnosis and therapy of human

133; 211pp; English.

\*~×××××β¤¢QαQµQ¤Q∂∱₽βQ¤Q₽⊱₽Ьŏööbbbcŏbbbboooïioïyo

relates to an isolated polynucleotide (I) encoding a

I) comprising a portion of a colon tumour protein. A new
le (III) that hybridises to (I) is useful for determining
if a cancer in a patient. (II) or antigen presenting cells
are useful for stimulating and/or expanding T cells
(tumour protein, by contacting T cells with (I), (II) or
ting cells that express (I). (I), (II), or antigen
Is that express (I). (I), (II), or antigen
is that express (I). (I), (II), or antigen
is that express (II), or antigen presenting cells that express (II),
voliferate, and administering to the patient an effective
proliferated T cells, thus inhibiting the development of a
patient. A new composition is useful in vaccines and
compositions for prevention and treatment of colon cancer.
agnosis and monitoring of the cancers (I), (II) or an
ist (II) is useful for detection, diagnosis and/ or therapy
cancer. (I) is useful as a probe or primer for nucleic
itation, and in the design and preparation of riboxyme
inhibiting expression of (II) in tumour cells. ABK29475isent human colon adenocarcinoma-specific cDNA sequences of

```

A single-stranded DNA (or its complementary strand or the corresp cstranded DNA) which comprises one of the 7837 "GS" sequences give AAT19001-T26837 and which is able to hybridise to part of human g DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences we obtained from 3'-directed cDNA libraries prepared from various human goly TO as the sole primer. Since the 3'-untranslated sequence we poly TO as the sole primer. Since the 3'-untranslated sequence is to a particular mRNA species, almost all the 3'-oriented cDNAs hy with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular man be determined (esp. using primers and probe the red from the GS sequences) as a means of diagnosing abnormal culturation or for recognising different cell types Claim 1; Page 1067; 2245pp; Japanese.

```

The present invention describes oligonuclectide libraries for det messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises oligonuclectides, each capable of hybridising selectively to a second messenger RNAs transcribed from a given transcription unit of the which encodes one or more messenger RNA splice variants. The oligonuclectide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitative quantitatively characterising the corresponding transcriptome, and electing RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised min libraries to detect transcripts of a sub-transcriptome under a pictological or pathological state, and so allowing the detection expressed and pathology-specific genes such as those genes only expressed specific tissue under a specific pathological condition; to and specific tissue under a specific pathological condition; to and developmental specific genes, and to detect RNA transcripts and variants of a transcriptome of a patient suffering from a partic disorder. ABN27233 to ABN59899 represent oligonucleotide sequencrats, humans and mice, which are used in the exemplification of present invention. N.B. The sequence data for this patent did no part of the printed specification, but was obtained in electroni directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

eotide libraries comprising oligonucleotides which sybridize to mRNAs transcribed from a transcription unit of a l for detecting tissue-, pathology-, and developmental-

Q ID NO 31339; 47pp; English

nvention describes oligonucleotide libraries for detecting a that populate a (sub-)transcriptome, where the (subwe comprises messenger RNAs transcribed from multiple
units that populate a genome. The library comprises several
des, each capable of hybridising selectively to a set of
a transcribed from a given transcription unit of the genome,
one or more messenger RNA splice variants. The
de libraries are useful for detecting mRNAs from a
miple, in expression profiling studies, in qualitatively or
y characterising the corresponding transcriptome, and in
transcripts and splice variants of human or animal
s: The libraries may also be used as specialised mini
detect transcripts of a sub-transcriptome under a particular
pathological state, and so allowing the detection of tissue
yy specific genes; and to detect and sub-transcriptome under a specific genes;
specific genes; and to detect form and sub-transcriptome under a specific genes. ntion. N.B. The sequence data for this patent did not form printed specification, but was obtained in electronic format transcriptome of a patient suffering from a particular 127253 to ABNS9589 represent oligonucleotide sequences from which are used in the exemplification of the WIPO at ftp.wipo.int/pub/published\_pct\_sequences mice,

The present invention describes oligonuclectide libraries for det messenger RNAs that populate a (sub-)transcribcd, where the (sub-)transcribcd messenger RNAs transcribcd from multiple transcription units that populate a genome. The library comprises oligonuclectides, each capable of hybridising selectively to a selection end of the messenger RNAs transcribed from a given transcriptly to a selective messenger RNAs plice variants. The oligonuclectide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitative quantitatively characterising the corresponding transcriptome, and quantitatively characterising the corresponding transcriptome, and cutering RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised militaries to detect transcripts of a sub-transcriptome under a pictological state, and so allowing the detection capacitic tissue under a specific pathological condition; to detect specific tissue under a specific pathological condition; to detect specific tissue under a specific pathological condition; to detect specific tissue under a specific pathological condition; to detect devent transcriptome of a patient suffering from a particut developmental specific genes; and to detect RNA transcripts and to detect RNA transcripts and to detect RNA transcripts and to detect RNA franscripts of a transcriptome of a patient suffering from a particut disorder. ABN27531 to ABN5589 represent oliques equence of a patient of a transcriptome of a patient suffering from a particut of a condition of a particut of a transcriptome of a patient suffering from a particut of a condition of a transcriptome of a patient suffering from a particut of a condition of a patient suffering from a particut of a condince of a patient suffering from a particut of a condition of a co New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription  $\upsilon$  genome, useful for detecting tissue-, pathology-, and development Mintz E, Mintz L, Faigler S; Example 1; SEQ ID NO 31597; 47pp; English. 28-JUL-2000; 2030US-0221607P 20-JUL-2001; 2001WO-IB001903 02-MAY-2001; 2001US-0287724P Shoshan A, Wasserman A, (COMP-) COMPUGEN INC WPI; 2002-257383/30. omologue designated Apo-3 ligand. Apo-3 ligand has civity. Apo-3 ligand can be used to induce apoptosis in cer cells, to induce NF-kappaB-dependent transcription and /SAPK-dependent responses in mammalian cells. The present seents an Apo-3 ligand probe, which is used in an example Ö

The invention relates to a system for detecting gene expression, comprises one or two isolated DNA molecules that detect expressic gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system if for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disea predicting therapeutic outcome, determining prognosis for a patic predicting disease complications in an individual or monitoring it treatment in an individual. The diseases include cardiac allogation, kidney allografit rejection, liver allogatic rejection, atherosclerosis, congestive heart failure, systemic lupus erythen rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
            New system for leukocyte expression profiling, diagnosing a disesmonitoring (the rate of) progression of a disease, e.g. atheroscl or congestive heart failure, comprises diagnostic oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1196 TTCAGGCACTAAGAGGGGCTGGACCTGGCGGCAGGAAGCCAAAGAGACTG 1245

New Tumor Necrosis Factor family receptor polypeptides and ligan useful for diagnosis and treatment of prostate cancer and develo or gestational abnormalities.

```
Fig 13B; 156pp; English.
```

n describes isolated Tumor Necrosis Factor (TNF) family peptides: APO4, APO6, APO8 and APO9 or their active disolated TNF related ligands 1 and 3 (TNRL1 and TNRL1) or fragments. APO4 is useful for diagnosing prostate cancer by evels of APO4 in an individual. Prostate cancer can also be APO4 selective binding agents linked to a therapeutic polypeptides are also useful for identifying selective s, useful in diagnosis/treatment of disease by binding of polypeptide/active fragment which is extracellular, or the cell surface. The binding is preferably performed in lypeptides/active fragments are also useful for screening and antagonists by binding and observing the changer in APO4 disease are also identified using APO4 polypeptides/active APO4 signal transducer molecules that specifically interact asmic domain of APO4 and detecting a change in level of APO4 method is performed in vivo or in vitro. APO polypeptides method is performed in vivo or in vitro. APO polypeptides agnosis/treatment of developmental or gestational duced apoptosis

Tumour necrosis factor related ligand - useful for, e.g. treating auto-immune disease and immune responses to tissue grafts.

Claim 2; Page 45-46; 69pp; English.

The sequence is that encoding mouse tumour necrosis factor relate (TRELL). TRELL or active fragments can be included with a carrier pharmaceutical compositions to treat cancer, autoimmune diseases immune responses to itssue grafts, or to stimulate or suppress the system. It is useful to screen for TRELL receptors, by labelling detectable label and screening compositions for binding. Agents interfering with TRELL receptor binding can also be screened for, then be administered, optionally with interferon-gamma, to induct death or treat, suppress or alter immune responses (especially in human adenocarcinoma cells) involving a signal pathway between TR its receptor. The DNA sequence can be used in gene therapy for TR related disorders in mammals (especially humans), e.g. tumours, autoimmune and inflammatory diseases or inherited genetic disorder introducing into cells, and expressing, therapeutically effective of a vector, e.g. a virus comprising a gene encoding TRELL. It me be of use in the preparation of prepare probes for screening therapeutically synthetic DNAs for TRELL-encoding sequences and for antic cherapy

The present invention relates to a method for predicting a toxic of a compound. The method comprises preparing a gene expression of a tissue or cell sample exposed to the compound, and comparing gene expression profile to a database compurising SEQ ID 1-4925, differential expression of the gene indicates at least one toxic The method is useful for predicting at least one toxic effect of compound, predicting hepatotoxicity or the progression of a toxic of a compound, identifying an agent that modulates the onset or progression of a toxic response, predicting the cellular pathway compound modulates in a cell, and identifying an agent that module present invention using a database of genes having liver toxin-idefferential expression, are useful in identifying proxicity mark
Predicting a toxic effect of a compound, useful in identifying t markers in liver tissues or cells for drug screening and toxicit comprises preparing gene expression profile of tissue or cells e

ucleic acids encoding PRO polypeptides, useful for treating ignant tumors, leukemias and lymphoid malignancies, angiogenic and immunologic disorders.

age 140; 302pp; English

nvention relates to the isolation of novel human PRO (AAU86128-AAU86162) and the polynucleotide sequences. The PRO Polypeptides, agonists, antagonists or anti-PRO e useful for treating benign or malignant tumours (e.g., bladder, breast, etc), leukaemias and lymphoid other disorders such as neuronal, glial, astrocytal, glandular, macrophagal, stromal and blastocoelic disorders, immune and angiogenic disorders. The polynucleotide also useful in gene therapy. The present sequence PCR primer used in the methods of the present invention

cid encoding a translationally controlled tumor protein, eating, preventing and diagnosing viral, tumor or diseases.

```
The present invention relates to novel nucleic acid sequences (AE MEZ73313), which are involved in the molecular pathways of tumour suppression, tumour reversion, apoptosis and/or virus resistance. sequences are also useful for treatment or prevention of viral, the sed diseases, and also for diagnosis and prognotese are also useful for treatment or prevention of viral, the secuence data for this patent is not represented in the printed specification but is based on sequence information supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; tumour suppressor; virucide; cytostatic; nootropic; neuroprotective; neuroleptic; gene therapy; tumour suppression; tumour reversion; apoptosis; viral resistance; viral infection; cell degeneration; Alzheimer's disease; schizophrenia; cancer; o

New human nucleic acid, useful for diagnosis, prognosis and treat e.g. of tumors, also related vectors, transformed cell, polypepti antibodies.

Disclosure; Page 120; 189pp; French.

The present invention relates to human oligonucleotides (Ab208641 AB209660). The expression of the oligonucleotides is implicated is suppression or reversion, apoptosis and/or viral resistance. The oligonucleotides are useful for preventing and/or treating viral infection, tumour development and cell degeneration (e.g. Alzheim disease and schizophrenia), especially cancer

A single-stranded DNA (or its complementary strand or the corresp stranded DNA) which comprises one of the 7837 "GS" sequences giv AAT19001-T26837 and which is able to hybridise to part of human g DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences w obtained from 3'-directed cDNA libraries prepared from various hu tissues; synthesis of CDNA was initiated from the 3'-end of mRNA poly (T) as the Bole primer. Since the 3'- untranslated sequence i to a particular mRNA species, almost all the 3'-oriented cDNAs by with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular mRNAs in a cDNA library can be determined (esp. using primers and probe detrived from the GS sequences) as a means of diagnosing abnormal Ü Gene signature; messenger RNA; mRNA; relative abundance; frequenc human; cloning; mapping; non-biased library; diagnosis; detection cell typing; abnormal cell function; ss. The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indica order and orientation of each sequence contist has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g. human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8% average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contist have been trimmed away, and each base is associat with a Phrap-derived quality score.

Sequencing vector: plasmid; n/a; 100% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319
Consensus quality: 212525 bases at least Q40
Consensus quality: 215255 bases at least Q30
Consensus quality: 215254 bases at least Q20
Insert size: 190000; agarose-fp
Insert size: 216885; sum-of-contigs
Quality coverage: 12.65x in Q20 bases; agarose-fp
Quality coverage: 11.08x in Q20 bases; sum-of-contig

\* NOTE: This is a 'working draft' sequence. It currently consists of 17 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that ha provided by the submittor.

This sequence will be replaced

\* by the finished sequence as soon as it is available and the accession number will be preserved.
